

Crystal Structure of 3,3,6,6,9,9-Hexamethyl- 1,2,4,5,7,8-hexa-oxacyclononane ("Trimeric Acetone Peroxide")

P. GROTH

Universitetets kjemiske institutt, Blindern, Oslo 3, Norway

The crystals are monoclinic with lattice parameters $a=13.92_5$ Å, $b=10.79_0$ Å, $c=7.97_0$ Å, and $\beta=91.6_4$ °. The space group is $P2_1/c$ and the cell contains four molecules. The phase problem was solved three-dimensionally by means of a computer procedure based on direct methods. Full-matrix least squares refinement gave the R -value 7.0 % for 1353 observed reflections. Rigid-body motion analysis including the S -tensor has been carried out. The molecule has approximately the symmetry D_3 and the nine-membered ring may be described in terms of a "twisted boat chair". The environment of the ring carbon atoms is asymmetric; the distortion may possibly be explained by *intra*-molecular repulsions between hydrogen atoms and oxygen atoms. The O—O distance is 1.48₃ Å and the C—O—O angle 107.₄°. The C—O bond length of 1.42₂ Å is significantly shorter than corresponding values for dimeric peroxides.

Trimeric acetone peroxide

has been synthesized by T. Ledaal at this university by oxidation of acetone by means of hydrogen peroxide in the presence of $HClO_4$. The crystal structure analysis was carried out as part of a study of the stereochemical features of cyclic organic peroxides.¹⁻⁴

CRYSTAL DATA

Trimeric acetone peroxide belongs to the monoclinic system, the systematic absences leading to the space group $P2_1/c$. The cell parameters at room temperature obtained from $h0l$ - and $hk0$ -precession diagrams, and their estimated standard deviations are:

$$\begin{array}{ll} a = 13.925 \text{ \AA} & \sigma(\text{\AA}) = 0.005 \\ b = 10.790 \text{ \AA} & \sigma(\text{\AA}) = 0.004 \\ c = 7.970 \text{ \AA} & \sigma(\text{\AA}) = 0.004 \\ \beta = 91.64^\circ & \sigma(\text{°}) = 0.05 \end{array}$$

The unit cell contains four molecules ($\rho_{\text{calc}} = 1.23 \text{ g.cm}^{-3}$, $\rho_{\text{obs}} = 1.22 \text{ g.cm}^{-3}$).

The intensity material was obtained from photometric measurements of integrated Weissenberg diagrams corresponding to $hk0$, $0kl \cdots 6kl$, and $h0l \cdots h5l$ ($\text{CuK}\alpha$ -radiation). The diagrams were taken at room temperature, and due to instability three crystals had to be used. 1353 independent reflections were strong enough to be measured while 465 were given $\frac{1}{4}I_{\text{min}}$ -values.

After cross-layer scaling the intensities were statistically put on absolute scale, and the overall temperature factor, $B = 2.5 \text{ \AA}^2$, was used in the calculation of unitary structure factors, and as starting parameter in the isotropic refinement.

No corrections have been made for absorption or secondary extinction effects.

DETERMINATION AND REFINEMENT OF THE STRUCTURE

The phase problem was solved three-dimensionally by means of a computer procedure (programmed in FORTRAN IV for CDC 3300) based on direct methods.⁵⁻⁷ As would be expected from the $|U|$ -distribution given in Table 1,

Table 1. Distribution of $|U|$ -values.

Range of $ U $	Number of reflections	Range of $ U $	Number of reflections
0.00–0.01	9	0.09–0.10	101
0.01–0.02	78	0.10–0.15	398
0.02–0.03	100	0.15–0.20	215
0.03–0.04	151	0.20–0.25	116
0.04–0.05	153	0.25–0.30	40
0.05–0.06	108	0.30–0.35	19
0.06–0.07	82	0.35–0.40	10
0.07–0.08	129	0.40–0.50	4
0.08–0.09	102	0.50–1.00	3

the programmed application of Harker-Kasper inequalities gave some sign relationships; in fact, 21 signs could be expressed in terms of two unknown and three origin-fixing signs. By applying a set of linked programs,⁸ 200 additional signs were determined in turn on basis of the four possible combinations of the two unknown, and the corresponding three-dimensional Fourier

syntheses were calculated and scanned for peaks greater than $1 \text{ e}\cdot\text{\AA}^{-3}$. The process was completed by a calculation of all distances less than 2 \AA between peak maxima.

Three of the sign combinations led to meaningless results, while the fourth Fourier synthesis contained 16 peaks greater than $2.5 \text{ e}\cdot\text{\AA}^{-3}$, 15 of which clearly showed the molecule. The 6 oxygen atoms came out with densities between 8 and $6 \text{ e}\cdot\text{\AA}^{-3}$ while the 9 carbon atoms corresponded to peaks with heights from 2.5 to $5 \text{ e}\cdot\text{\AA}^{-3}$.

The R -factor corresponding to the coordinates thus obtained and the statistically determined overall temperature factor was $R=26.1 \%$ for the 500 largest structure factors. Using a program based on the minimum residual method,⁹ this R -value was reduced to 10.4% .

A full-matrix least squares refinement⁸ was carried out. The weighting scheme No. 1:

$$\begin{aligned} \text{for } F_o \leq FB, \quad W &= A1(F_o)^{B1} \\ \text{for } F_o > FB, \quad W &= A2(F_o)^{B2} \end{aligned}$$

^a For numbering of atoms, see Fig. 1.

was adapted by taking:

$$A1=10.0, A2=15.8, B1=0.0, B2=-0.5 \text{ and } FB=2.5$$

The atomic form factors used were those of Hanson *et al.*¹⁰

After 3 cycles of isotropic refinement, anisotropic thermal vibrational parameters were introduced for the oxygen and carbon atoms. 15 hydrogen atoms could be localized from a difference Fourier map while the positions of the remaining three were calculated assuming tetrahedral C—H bonds of length 1.05 Å. Reflections corresponding to $\sin \theta/\lambda < 0.45$ were included in the refinement of hydrogen positional parameters (an attempt to refine isotropic temperature factors was unsuccessful and a constant value $B=5.0 \text{ \AA}^2$ was used). The R -value arrived at for 1353 observed reflections was 7.0 %. 465 accidentally absent reflections had previously been given the value $\frac{1}{2}I_{\min}$ and had been scaled along with the rest of the data although not used in any calculations of scale factors. Allowance for the inclusion of these reflections in the least square refinement was made by applying weighting scheme No. 3 ($W=1/\sigma$). Satisfactory weight analysis was obtained by giving all

Table 3. Anisotropic thermal vibration parameters and their estimated standard deviations (multiplied by 10^5).

^a Referring to Fig. 1 the hydrogen atoms H_{n1}, H_{n2}, H_{n3} are bonded to C_n.

unobserved reflections the same constant weight $W=Al/3$. The *R*-factor for all data was 9.6 %.

A final difference Fourier map calculated with the observed data and with phases determined by the parameters corresponding to $R=7.0\%$ contained no positive or negative regions greater than $0.3 e \cdot \text{\AA}^{-3}$.

When checking the 221 signs originally determined, no discrepancies were found.

The fractional atomic coordinates and the thermal vibration parameters arrived at are given in Tables 2, 3, and 4; the expression for the anisotropic vibrations being:

$$\exp -(B_{11}h^2 + B_{22}k^2 + B_{33}l^2 + B_{12}hk + B_{13}hl + B_{23}kl)$$

In Table 5 calculated structure factors are compared with the observed values (and unobserved with $F_u = \frac{1}{2} F_o(\min)$).

THERMAL MOTIONS

The principal axes of the thermal vibration ellipsoids for oxygen and carbon atoms were calculated from the temperature parameters given in Table 3. Root mean square amplitudes and the corresponding *B*-values for the atomic anisotropic thermal vibration along the principal axes together with the components of these axes along the crystal axes are given in Table 6.

The thermal vibration parameters of Table 3 were applied in rigid-body analyses of translational and librational motion by (I) assuming that the axes of libration intersect at the center of gravity,¹¹ (II) assuming that the axes of libration intersect at a point,¹² and (III) by including the *S*-tensor in order to account for correlations of libration and translation.¹³

Table 5. Observed (and unobserved with $F_u = \frac{1}{2} F_o$ (min)) and calculated structure factors on 10 times absolute scale.

The results are summarized in Tables 7, 8, and 9.

From Table 7 it may be seen that the moment of inertia about the principal axes I_1 and I_2 are approximately equal, thus implying rotational symmetry of the molecule.

A comparison of Tables 7, 8, and 9 shows that the *magnitudes* of the corresponding principal axes of \mathbf{T} and \mathbf{L} agree closely while the directions deviate considerably. The angular deviations are:

(I) compared with (III) (II) compared with (III)

principal axis	\mathbf{T}	\mathbf{L}	\mathbf{T}	\mathbf{L}
1	57°	36°	40°	50°
2	58°	63°	60°	57°
3	44°	60°	73°	46°

The r.m.s. deviation of the observed U_{ij} from those calculated with the rigid-body parameters (corrected appropriately for the number of degrees of freedom) is significantly smaller when the \mathbf{S} -tensor is included than for the two other methods of analysis.

In analysis (I) the direction of the principal libration axis corresponding to the minimum angular oscillation, L_3 , is approximately parallel to I_3 , the principal axis of maximum moment of inertia. This effect is less pronounced when method (II) is used and no such correlation is found in analysis (III).

The position of the origin that symmetrizes \mathbf{S} (Table 9) may be compared with the center of libration arrived at in analysis (II) (Table 8). The displacement from the center of mass is in the same direction for each method of analysis, and also the magnitudes agree fairly well.

Table 6. The principal axes of the thermal vibration ellipsoids given by the components of a unit vector in fractional coordinates e_x , e_y , e_z ; the corresponding r.m.s. amplitudes, and the B -values.

 \mathbf{T} is the reduced translation tensor(d) In the x , y , z system, i.e. in fractions of a , b , c .

Start origin (center of gravity)

$$x = 0.2492, \quad y = -0.0072, \quad z = 0.0377$$

Symmetrizing origin

$$x = 0.2249, \quad y = -0.0082, \quad z = 0.0575$$

Table 9 shows that the *effective translation*, defined as the screw pitch, σ_i , multiplied with the r.m.s. amplitude of libration about the axis L_i , is small in the direction of the axis corresponding to the largest angular oscillation. The corrections in fractional coordinates for librational effects¹⁴ may be found in Table 10, which shows that all corrections are less than three times the corresponding standard deviation of the coordinate.

Table 10. Corrections in fractional atomic coordinates due to libration compared with estimated standard deviations of the coordinates. (The Δ 's and σ 's are multiplied by 10^6).

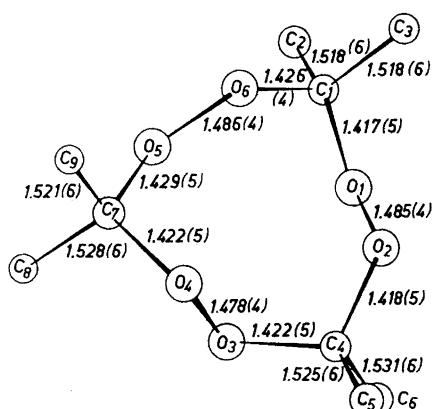

Fig. 1. Schematic drawing of the molecule showing interatomic distances.

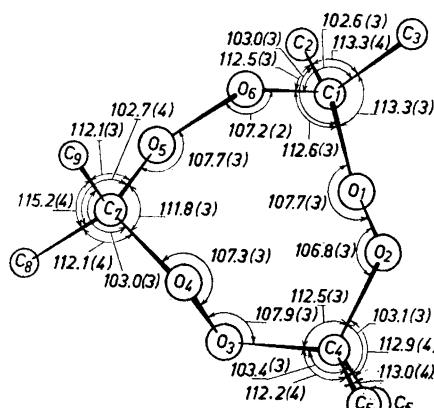

Fig. 2. Schematic drawing of the molecule showing bond angles.

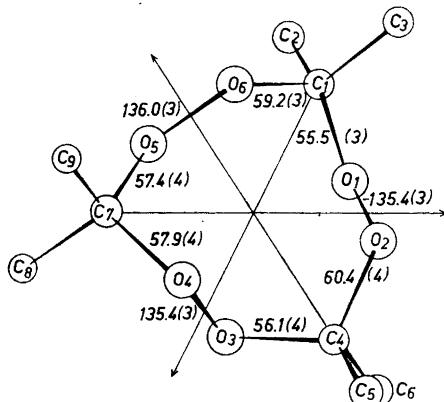

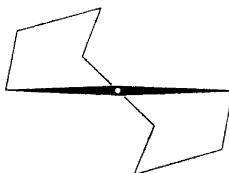

Fig. 3. Schematical drawing of the molecule showing dihedral angles. The approximate two-fold axes of symmetry are indicated.

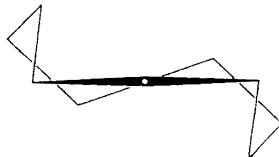

DISCUSSION

Interatomic distances and angles (corrected for librational effects) may be found in Figs. 1 and 2 while the dihedral angles are shown in Fig. 3. The standard deviations, given in parentheses, have been calculated from the correlation matrix corresponding to the last full-matrix least squares refinement cycle without taking into account the E.S.D.'s of the cell parameters. In all figures and tables the standard deviations of distances and angles have been multiplied by 10^3 and 10, respectively. The largest correction for libration in distances and angles are $1.5 \times \sigma_d$ and $0.8 \times \sigma_a$, where σ_d and σ_a are the corresponding standard deviations. The C—H distances arrived at range from 0.83 Å to 1.08 Å with estimated standard deviations of about 0.06 Å.

The only crystal structure analysis reported of a saturated nine-membered ring is that of cyclononylammonium bromide¹⁵ where the conformation of the ring skeleton roughly may be described in terms of a twisted chair boat, TCB,¹⁶ with a two-fold axis of symmetry:

The conformation of the nine-membered ring of trimeric acetone peroxide corresponds closely to the twisted boat chair, TBC,¹⁶ with symmetry D_3 :

The approximate three-fold symmetry of the whole molecule is confirmed by the distances and angles listed in Table 11. A unit vector, \mathbf{n}_3 , along the three-fold axis of rotation is given by

$$\mathbf{n}_3 = -0.016 \cdot \mathbf{a} + 0.086 \cdot \mathbf{b} + 0.035 \cdot \mathbf{c}$$

Table 11. Distances and angles (with estimated standard deviations in parentheses) between approximately three-fold symmetry related atoms.

C_3-C_8	4.909 (6)	$C_8-C_6-C_3$	59.6 (1)
C_4-C_8	4.908 (7)	$C_8-C_2-C_6$	60.2 (1)
C_3-C_5	4.998 (6)	$C_9-C_5-C_9$	59.5 (1)
C_3-C_9	4.943 (7)	$C_9-C_9-C_3$	60.6 (1)
C_6-C_9	4.961 (7)	$C_9-C_3-C_6$	59.9 (1)

A least squares plane defined by the carbon and oxygen atoms gives the following fit:

Atoms defining the plane	Deviations (Å)	Atoms defining the plane	Deviations (Å)
C_1	-0.005	O_5	-0.543
C_4	0.002	O_6	0.545
C_7	-0.001	C_2	-1.212
O_1	-0.520	C_3	1.173
O_2	0.570	C_5	1.173
O_3	-0.530	C_6	-1.200
O_4	0.550	C_8	-1.212
		C_9	1.188

Within probable limits of error, C_1 , C_4 , and C_7 are in the plane, while the atoms O_1 , O_3 , O_5 , C_2 , C_6 , C_8 , respectively, are situated approximately as far below the plane as O_2 , O_4 , O_6 , C_3 , C_5 , C_9 are above it. This fact, together with the distances given in Table 12, implies that the molecule has the three approximate two-fold axes of symmetry indicated in Fig. 3. The total symmetry of the molecule is accordingly close to D_3 .

Table 12. Distances (with estimated standard deviations in parentheses) between approximately two-fold symmetry related atoms.

Distance	(Å)	Distance	(Å)	Distance	(Å)
C ₁ —O ₂	2.344 (4)	C ₄ —O ₄	2.345 (5)	C ₇ —O ₆	2.354 (5)
C ₁ —O ₅	2.345 (4)	C ₄ —O ₁	2.332 (5)	C ₇ —O ₃	2.336 (5)
C ₁ —C ₅	4.551 (6)	C ₄ —C ₉	4.535 (6)	C ₇ —C ₃	4.554 (6)
C ₁ —C ₈	4.539 (6)	C ₄ —C ₂	4.505 (6)	C ₇ —C ₆	4.538 (6)
C ₁ —C ₆	4.155 (6)	C ₄ —C ₈	4.159 (6)	C ₇ —C ₂	4.172 (6)
C ₁ —C ₉	4.189 (7)	C ₄ —C ₃	4.208 (6)	C ₇ —C ₅	4.198 (6)
C ₁ —O ₃	3.560 (5)	C ₄ —O ₅	3.547 (5)	C ₇ —O ₁	3.587 (4)
C ₁ —O ₄	3.569 (5)	C ₄ —O ₆	3.547 (5)	C ₇ —O ₂	3.559 (5)

From Figs. 1 and 2 it may be seen that, within error limits, the independent C—C, C—O, and O—O distances as well as the angles C—O—O and O—C—O, respectively, are equal. Their mean values are compared with earlier findings¹⁻³ in Table 13, where standard deviations have been calculated by regarding the

Table 13. Mean values of interatomic distances (Å) and angles (°) compared with earlier findings. Estimated standard deviations are given in parentheses.

Distance/angle	Dimeric cyclohexanone peroxide	Dimeric cycloheptanone peroxide	Dimeric cyclooctanone peroxide	Trimeric acetone peroxide
C—C	1.526 (3)	1.536 (5)	1.523 (2)	1.524 (3)
C—O	1.440 (2)	1.441 (3)	1.446 (1)	1.422 (2)
O—O	1.482 (2)	1.472 (3)	1.474 (2)	1.483 (2)
C—O—O	107.3 (1)	107.9 (1)	108.1 (1)	107.4 (1)
O—C—O	108.2 (2)	108.9 (3)	107.3 (1)	112.3 (2)
C—C—O	104.9 (1)	103.2 (2)	103.6 (1)	103.0 (1)
C—C—O	112.7 (3)	112.1 (2)	111.7 (1)	112.5 (2)

individual distances and angles as independently determined. The significantly shorter C—O bond length of the present compound may possibly be related to the fact that the O—C—O angle is opened by more than 4° compared to the dimeric peroxides.

The arrangements around the carbon atoms C₁, C₄, and C₇ are all asymmetric in a fashion which is illustrated in Fig. 4. Neither the six large nor the six small C—C—O angles are significantly different (Fig. 2), and the mean values are compared with those of the dimeric peroxides in Table 13. It should be pointed out, however, that in the present structure the C_A—C_R—C_B groups are rotated *ca.* 6.5° about the approximate two-fold axes, which are *in* the C_A—C_R—C_B planes, while for the dimeric peroxides

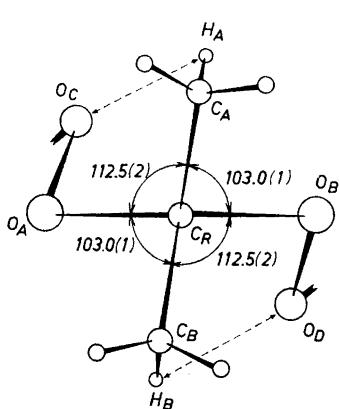

Fig. 4. Schematic drawing of a part of the molecule viewed along the approximate two-fold axis of symmetry, showing the asymmetric environment of the C_R -atoms.

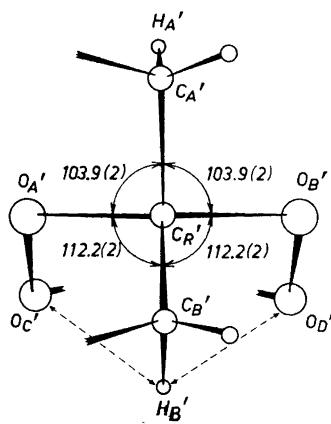

Fig. 3. Schematic drawing showing the asymmetric environment of the spiro carbon atoms of dimeric peroxides.

the rotation is about an axis, through $C_{R'}$, normal to the $C_{A'}-C_{R'}-C_{B'}$ plane as indicated in Fig. 5. The angles between the three pairs of $O_A-C_{R'}-O_B$ and $C_A-C_{R'}-C_B$ planes are 96.9° , 96.4° , and 96.4° for $R=1,4$, and 7, respectively.

It seems reasonable to relate the effect to *intra-molecular* oxygen-hydrogen repulsions; between O_C and H_A (Fig. 4), and between O_D and H_B . A calculation of these (equal) distances in an undistorted model with staggered conformations of the methyl groups gives an $O-H$ distance of about 2.4 \AA ; the sum of the van der Waals radii of oxygen and hydrogen being *ca.* 2.6 \AA . The corresponding distances in the dimeric peroxides are even somewhat shorter.

Unfortunately, the determination of hydrogen atom positions in this structure is very poor, and no statements concerning the extent to which the distortions influence the $O-H$ contacts can be made with confidence.

The shortest *inter-molecular* $O-H$ and $H-H$ contacts are 2.67 \AA and 2.37 \AA , respectively.
