

# The Crystal and Molecular Structure of 1-Thiacyclobutane-3-carboxylic Acid-1-oxide

SIXTEN ABRAHAMSSON and GUNNAR REHNBERG

*Crystallography Group, Swedish Medical Research Council Unit for Molecular Structure Analysis, University of Göteborg, P.O.B., S-400 33 Göteborg 33, Sweden*

The high melting isomer of 1-thiacyclobutane-3-carboxylic acid-1-oxide ( $C_4H_6O_3S$ ) is orthorhombic ( $Pna2_1$ ) with  $a = 9.89 \pm 0.05$ ,  $b = 5.41 \pm 0.02$ , and  $c = 10.81 \pm 0.08$  Å. The molecule has the *trans* configuration and shows a puckered four membered ring (dihedral angle 153°). The molecules are held together by hydrogen bonds between the carboxyl and sulphoxide groups.

1-Thiacyclobutane-3-carboxylic acid-1-oxide ( $C_4H_6O_3S$ ) was prepared by Allenmark.<sup>1</sup> He found that the synthetic product had a diffuse melting point and interpreted this as due to the presence of the geometric isomers which are possible because of the ring system. A separation of the two forms was possible by repeated recrystallization from ethyl acetate or acetone. One modification melted at 130.5–133.0°C whereas the other (isolated from the mother liquor) melted between 133°C and 138°C. Crystals from the high melting form were used for a crystal structure determination.

## EXPERIMENTAL

Crystals of  $C_4H_6O_3S$  are orthorhombic ( $Pna2_1$ ) with the following unit cell dimensions:  $a = 9.89 \pm 0.05$ ,  $b = 5.41 \pm 0.02$ , and  $c = 10.81 \pm 0.08$  Å. The intensity data were collected with the Weissenberg technique using  $CuK\alpha$  radiation. Rotation about the  $b$ -axis gave layers 0–4, and about the  $c$ -axis layers 0–7. The film intensities were measured on the automatic film scanner<sup>2</sup> developed at this institute. They were then scaled<sup>3</sup> together to a set of 532 independent reflexions. The intensities were corrected for the Lorentz and polarization factors but not for absorption.

## STRUCTURE DETERMINATION

The sulphur atom was found from a sharpened Patterson series and the remaining atoms were then located from successive electron density and difference syntheses. The hydrogen atom of the carboxyl group was found at the expected position but was poorly defined. This has been the case in rather

Table 1. Observed and calculated structure factors. The phase angles are given as fractions of one revolution.

any structures with hydrogen bonding both with film scanner and diffractometer data. All hydrogen atoms were, however, included in the following structure factor calculations at their calculated positions with isotropic temperature factors corresponding to those of the parent atom. The refinement was performed by least-squares using anisotropic thermal parameters for all non-hydrogen atoms. The hydrogen parameters were not varied. The final *R*-value is 0.097 for all observed independent reflexions. In the refinement the residual  $\sum w (|F_o| - |k|F_c|^2)$  was minimized where the weight *w* was

$$\frac{1}{1 + \left( \frac{|F_o| - 4.42|F_{\min}|}{6.19|F_{\min}|} \right)^2}$$

The form factors of the International Tables for X-Ray Crystallography<sup>4</sup> were used. The calculations were performed with the program system of Abrahamsson *et al.*<sup>5</sup>

## RESULTS

A list of the final set of observed and calculated structure factors is given in Table 1, the atomic parameters in Tables 2 and 3. The interatomic distances and angles are shown in Fig. 1, and with standard deviations in Table 4. There are no unexpected features in these values.

Table 2. Fractional coordinates for the atoms of the structure. The standard deviations (within brackets) are multiplied by 10<sup>4</sup> for *x*, *y*, and *z*, respectively.

From the stereoscopic drawing given in Fig. 2 it is obvious that the high melting form of  $C_4H_6O_3S$  has the *trans* configuration.

The four membered ring is non-planar. The dihedral angle between the planes defined by C(1), S(1), C(3) and C(1), C(2), C(3) is  $153^\circ$ , which agrees well with the values usually found in puckered cyclobutane rings.<sup>6</sup> The carboxyl group is roughly perpendicular to the four membered ring. The angle between the planes C(1), C(2), C(3) and O(2), C(4), O(3) is  $98^\circ$ .

The packing of the molecules is shown in Fig. 3. The molecules are linked together by hydrogen bonds between the carboxyl and the sulfoxide group. The I O(1) and III O(2) distance is 2.63 Å. The other intermolecular contacts

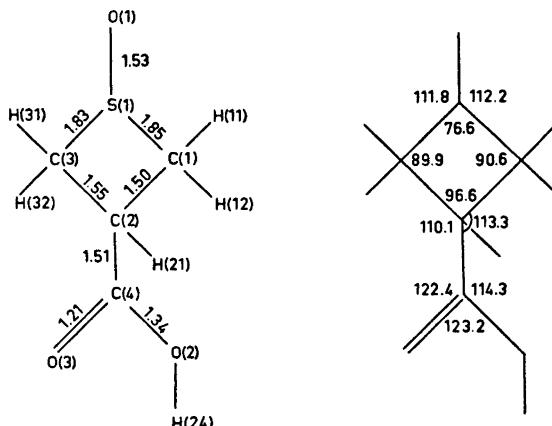

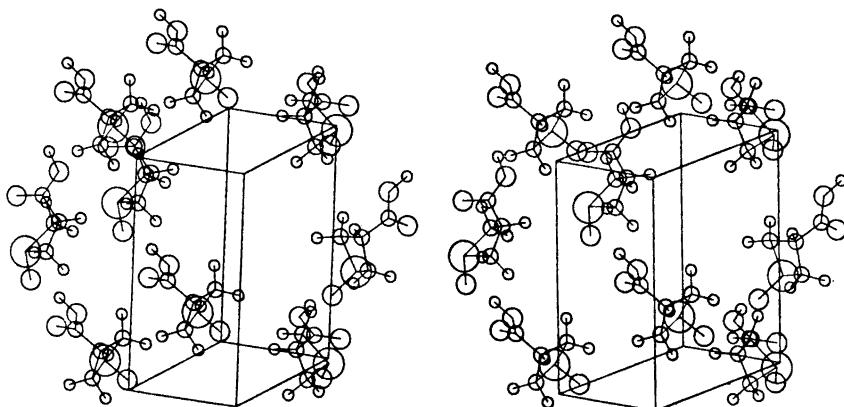

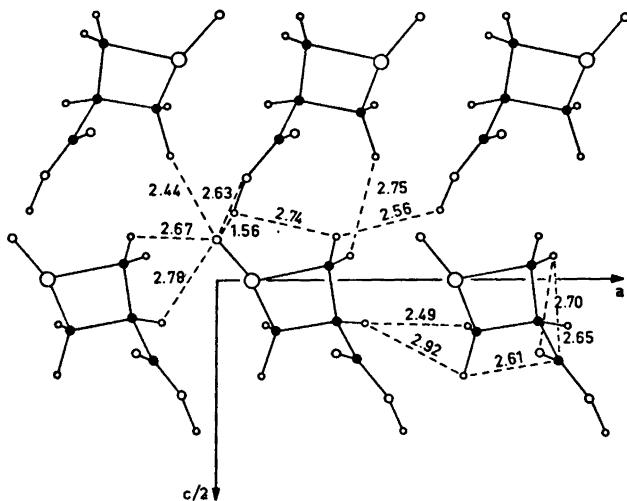

Fig. 1. Interatomic distances and angles of  $C_4H_6O_3S$ . The atomic numbering is also indicated.

Fig. 2. Stereoscopic pair of  $C_4H_6O_3S$ .Fig. 3. Molecular packing of  $C_4H_6O_3S$ . Some short intra- and intermolecular contacts are shown.

as well as the nonbonded intramolecular distances indicate normal packing conditions.
