C-Alkylation of Pyrimidines by an Oxoalkyl Reactant

MICHEL GACEK, LEIF ONGSTAD and KJELL UNDHEIM

Department of Chemistry, University of Oslo, Blindern, Oslo 3, Norway

Certain 2-pyrimidinones are active metaphase inhibitors.\(^1\) In this work we describe a route developed for the synthesis of some 4-acetyl derivatives 6 – 8 of 2-pyrimidinones. An essential feature of the synthesis is the adduct formation between an electron deficient pyrimidine system and acetone. Such an addition was to be expected from the tendency of covalent hydration in nitrogen heterocycles.\(^2,3\) For this to occur in monocyclic systems the ring should contain two doubly bonded nitrogen atoms and an electron withdrawing substituent.\(^4\) Thus 5-nitropyrimidines are largely hydrated,\(^5\) whereas hydration of 2-pyrimidinone is normally not seen but could be demonstrated by kinetic deuteration experiments.\(^6\) Activation by N-quaternization results in the analogous pseudo-base formation.\(^7\) Addition of other nucleophiles have been less extensively studied.\(^7,8\) We now have found 5-chloropyrimidin-2-one containing a carbonyl function in the 4-position to be readily covalently methanolated and acetylated. When the latter adduct is dehydrogenated, the overall effect is a substitution of a hydrogen in the pyrimidine ring with a carbon substituent.

The starting pyrimidine 1 in the synthesis was prepared by condensation between S-methylsulfoxonium iodide and mucochloric acid.\(^6\) 1 was oxidised to the methyl sultone 2 with peroxyacetic acid.\(^9\) Hydrolysis in aqueous alkali of the latter yielded the lactam 3 which was esterified to 4a in methanol with acid catalysis. 4a was isolated as the covalently methanolated adduct 9a, which, however, readily lost methanol on warming. A substituent such as a methy group on N-1, 4b, did not noticeably affect the tendency for methanol adduct formation; recrystallization of 4b from methanol yielded 9b. In \(^1\)H NMR H-6 in the pyrimidines 4a and 4b resonates as a sharp singlet at \(\delta\) 8.1 and 8.5, and in the respective methanol adducts as broad singlets at \(\delta\) 5.3 and 5.4. Both 4a and 4b added acetone with acid catalysis; the N-methyl group in 4b appeared to slightly decrease the reaction rate. Presumably it is the enol form of acetone which adds to a protonated pyrimidine molecule. \(^1\)H NMR showed that H-6 in the adducts 5a and 5b resonates as a partly resolved quartet at \(\delta\) 4.8 and 4.6. The mass spectra of the methanol adducts 9 show that these are thermally dissociated into the parent pyrimidines 4 and methanol in the mass spectrometer. The acetone adducts 5, however, are volatile intact since the molecular ion signal for the parent pyrimidines 4 was absent and a major fragment in the spectra at \([M - 57]\) corresponds to electron impact induced expulsion of \(\text{CH}_2\text{CHO}_2\) from the molecular ion of 5.

Dehydrogenation of 5a to the pyrimidine was achieved using 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (DDQ). \(^1\)H NMR in trifluoroacetic acid (TFA) showed that 6, as well as 7 and 8, exists predominantly as the acetonylidene tautomer (Scheme 1) rather than as the corresponding acetylnyl tautomer. This preference is attributed to conjugation with the keto-carbonyl group. The ester hydrolysis of 6 to 7 was run in aqueous alkali and finally the acid 7 could be decarboxylated to 8 in good yield by heating a solution of 7 in anisole.

**Scheme 1.** 4-Carboxy-5-chloropyrimidin-2-one 3. 2-Methylsulfonyl-4-carboxy-5-chloropyrimidine \(^{10}\) (32 mmol) was added in portions to 5 M NaOH (30 ml) with stirring; the reaction was slightly exothermic. The mixture was stirred without heating for 30 min and then acidified to pH ca. 1 with HCl. The precipitate collected was washed with water and dried in
vacuo at 60 °C over NaOH pellets; yield 91 %, m.p. 145–147 °C (dec.). Anal. C₇H₈ClN₂O₂; C, H. H NMR (DMSO-d₆): δ 6.80 (H-6).

4-Methoxy carbonyl-5-chloropyrimidine-2-one 4a. 4-Methoxy carbonyl-5-chloropyrimidine-2-one (11 mmol) was dissolved in methanol which was saturated with HCl gas. The solution was left at room temperature for 17 h before evaporation. The residue was recrystallized from methanol and dried at 70 °C; yield 82 %, m.p. 160–161 °C. Anal. C₉H₈ClN₂O₂; C, H. H NMR (CDCl₃): δ 4.00 (4-CO₂Me), 8.50 (H-6).

1-Methyl-4-methoxy carbonyl-5-chloropyrimidine-2-one 4b. 4-Methoxy carbonyl-5-chloropyrimidine-2-one (20 mmol) was added to 0.34 M methanolic potassium methoxide (75 ml, 25 mmol) and the resultant solution evaporated to dryness under anhydrous conditions. The dried potassium salt thus obtained was suspended in anhydrous DMF (100 ml), methyl iodide (42 mmol) added, and the mixture stirred at room temperature for 2 h. The solvent was then distilled off at reduced pressure, the residue extracted with chloroform (100 ml) and the chloroform solution washed with 0.2 M NaOH (2 × 5 ml) and dried (MgSO₄) before evaporation. The resultant product, after recrystallization from methanol, was dried at 80 °C (0.1 Torr); yield 52 %, m.p. 135 °C. Anal. C₉H₈ClN₂O₂; C, H. H NMR (CDCl₃): δ 3.67 (N-Me), 3.97 (4-CO₂Me), 8.14 (H-6).

4-Methoxy carbonyl-5-chloro-6-(2-oxopropyl)-1,6-dihydropyrimidin-2-one 5a. 4-Methoxy carbonyl-5-chloropyrimidine-2-one (18 mmol) in a solution of acetone (75 ml) and conc. HCl (0.2 ml) was heated under reflux for 90 min. After evaporation the residual material was crystallized from chloroform–isopropyl ether; yield 78 %, m.p. 127 °C. Anal. C₁₃H₁₂ClN₂O₃; C, H. H NMR (CDCl₃): δ 2.22 (COMe), 2.99 (CH₂CO₂M), 3.90 (4-CO₂Me), 4.75 (H-6, partly resolved q).

1-Methyl-4-methoxy carbonyl-5-chloro-6-(2-oxopropyl)-1,6-dihydropyrimidin-2-one 5b was obtained by heating 1-methyl-4-methoxy carbonyl-5-chloropyrimidine-2-one under reflux in acetone and conc. HCl as above for 210 min; yield 90 %, m.p. 132 °C (CHCl₃–iPr₂O). Anal. C₁₃H₁₂ClN₂O₃; C, H. H NMR (CDCl₃): δ 2.22 (COMe), 2.90 (CH₂CO₂M), 2.94 (N-Me), 3.90 (4-CO₂Me), 4.55 (H-6, q).

4-Methoxy carbonyl-5-chloro-6-(2-oxopropyl)-pyrimidine-2-one 6. 4-Methoxy carbonyl-5-chloro-6-(2-oxopropyl)-1,6-dihydropyrimidin-2-one (12 mmol) was dissolved in dioxane (50 ml) together with DDQ (14 mmol). The reaction mixture was stirred at room temperature for 3 days and then filtered. The residual material was crystallized from chloroform–isopropyl ether; yield 50 %, m.p. 225–226 °C. Anal. C₁₃H₁₂ClN₂O₂; C, H. H NMR (TFA): δ 2.43 (CO₂Me), 6.33 (–CH=); (the acetonilidene tautomer).

4-Carboxy-5-chloro-6-(2-oxopropyl)pyrimidine-2-one 7. 4-Methoxy carbonyl-5-chloro-6-

(2-oxopropyl)pyrimidine-2-one (26 mmol) was added to 1 M NaOH (5 ml) and the mixture stirred at room temperature for 1 h. The reaction mixture was then acidified to pH ca. 1 and the precipitated material recrystallized fromaq. methanol; yield 67 %, m.p. 192 °C (dec.). Anal. C₁₇H₁₃ClN₃O₃; C, H. H NMR (TFA): δ 2.46 (COMe), 6.35 (CH=); (the acetonilidene tautomer).

4-(2-Oxopropyl)-5-chloropyrimidin-2-one 8. 4-Carboxy-5-chloro-6-(2-oxopropyl)pyrimidine-2-one (1.3 mmol) was added to anisole (2 ml) and the resultant solution heated under reflux for 45 min. After evaporation at reduced pressure the residue was crystallized from chloroform–diisopropyl ether; yield 85 %, m.p. 197 °C. Anal. C₁₇H₁₃ClN₃O₃; C, H. H NMR (TFA): δ 2.50 (COMe), 6.06 (CH=), 7.85 (H-6); (the acetonilidene tautomer).

4-Methoxy carbonyl-5-chloro-6-methoxy-1,6-dihydropyrimidin-2-one 9a. When 4-methoxy carbonyl-5-chloropyrimidine-2-one 4a after recrystallization from methanol is dried in vacuo at room temperature instead of heating as when 4a is desired, the covalently bound methanol adduct is obtained. Anal. C₁₇H₁₃ClN₃O₃; C, H. H NMR (CDCl₃): δ 3.33 (6-OMe), 3.93 (4-CO₂Me), 5.30 (H-6).

1-Methyl-4-methoxy carbonyl-5-chloro-6-methoxy-1,6-dihydropyrimidin-2-one 9b was similarly obtained on recrystallization of 4b from methanol and drying at room temperature. Anal. C₁₇H₁₃ClN₃O₃; C, H. H NMR (CDCl₃): δ 3.08 (N-Me), 3.20 (6-OMe), 3.97 (4-CO₂Me), 5.38 (H-6).
